

Anderson Silva

AI Engineer · TypeScript / Node.js · Real-time & Multiplayer Systems

São Paulo, Brazil (UTC-3) · Open to remote work worldwide · anderson@kolja.com.br · [koljacria.github.io](https://github.com/koljacria) · linkedin.com/in/oriontis

SUMMARY

AI-native software engineer, building software since 2010. I design systems and direct AI coding agents to build them, holding every step to automated tests, which lets me ship large, working systems quickly. Recent work spans multi-agent orchestration, identity and security infrastructure, an end-to-end encrypted offline messenger, and a physics-based multiplayer game.

SKILLS

AI & LLM: multi-agent orchestration, agentic coding workflows, provider-agnostic multi-model routing, local LLMs, adversarial testing

Backend: TypeScript, Node.js, Python, PostgreSQL / Supabase, Convex, SQLite, JSON-RPC, SSE, REST APIs

Security & identity: OIDC / SSO, passkeys / WebAuthn, JWS / JWKS, X25519, AES-GCM, HKDF, DTLS

Games & graphics: Godot 4 (GDScript), Jolt physics, server-authoritative networking, Three.js, WebGL / GLSL, Metal / MetalFX

Mobile & desktop: Android (Java, WebView), Swift / macOS, progressive web apps, browser extensions

Signal processing: Web Audio API, DSP, acoustic modem design, sensor signal decoding

EXPERIENCE

AI & Systems Engineer — Lucentive

Remote · Apr 2026 – Sep 2026

- Built Aura's agent-to-agent client: signed service discovery, fail-closed JWS/JWKS verification, JSON-RPC over bounded SSE, covered by 33 adversarial tests.
- Built the core of Icarus, an AI application-generation platform with provider-agnostic multi-model orchestration and build and verification gates.
- Designed Lucentive One identity infrastructure: OIDC single sign-on and passkeys; extended merge-safety CI checks and adversarial test coverage.
- Ran the company's game-development unit (Lucentive Games) as its sole developer.

Independent Software Engineer — Kölja

São Paulo · 2010 – present

- Self-employed developer of games, applications and AI tools for 15+ years, including Nightmare Engine, a released horror game on my own retro-graphics engine. Founded the Kölja games and music studio in 2026.

SELECTED PROJECTS

Salt Meridian — multiplayer pirate trading game

Godot 4.7 · creator & technical director · in development

- Real sailing physics: buoyancy from the hull's own volumes, sail lift and drag from the apparent wind, a rudder that stalls.
- Server-authoritative multiplayer with every connection encrypted (DTLS); accounts with challenge-response sign-in, staff roles and an audit log; Linux dedicated server with deploy, rollback and backup scripts.
- AI bot captains that sail, trade and fight under the same physics as players. About 68,000 lines of GDScript and 208 test suites, built with AI coding agents under my direction.

Lume — offline, end-to-end encrypted messenger

Android + macOS · creator · private

- Devices pair and chat with no network at all: QR codes, screen and flashlight blinks, near-ultrasonic sound, and a magnetic-field channel read by the phone's magnetometer.
- Per-chat X25519 handshake, AES-GCM messages and re-keying; custom text compression (~3 bits per character) and an 18-tone acoustic modem; unit and two-device end-to-end tests.

Project Artemis — local AI agent for security and computer automation

creator · ongoing

- Runs entirely on the owner's hardware, with no cloud inference: persistent SQLite memory, filesystem-native skills, dual-model dispatch, shell and file operations.

Pocket VR — Android VR desktop for phone headsets

Android · v1.4 · tested on device

- Six 3D environments, side-by-side browsing, local files, controller keyboard and voice typing, plus a sandboxed package format for third-party apps and games.

EDUCATION & LANGUAGES

Artificial Intelligence & Advanced Data-Science Tools — Universidade Presbiteriana Mackenzie · 2020

Postgraduate specialization in Law — IFRS · 2025

Languages: Portuguese (native) · English (fluent) · Spanish (professional working)
