

AI & Systems Engineer / Game Development Lead

São Paulo, Brazil · anderson@kolja.com.br
koljacria.github.io · linkedin.com/in/oriontis

AI and systems engineer building software since 2010. Creator and senior architect of Project Artemis, and Head of Game Development at Lucentive Games. Work spans local AI agents, cryptographic trust, identity, game systems, and generative audio and visual tools.

EXPERIENCE & LEADERSHIP

Head of Game Development | Lucentive Games / Current

- Responsible for Lucentive Games and sole developer of **Devil Torn**, an Amazonian hack-and-slash in development.
- Build gameplay, combat, world systems, and presentation, including chained-blade mechanics, animal forms, environmental corruption, and restoration.

AI & Systems Engineer | Lucentive / 2026 - Present

- **Aura**: built an agent-to-agent client with signed discovery, fail-closed JWS/JWKS verification, JSON-RPC, and bounded SSE; 33 adversarial tests.
- **Icarus**: built the core of an AI application-generation platform with provider-agnostic multi-model orchestration and build-and-verify gates.
- **Lucentive One**: designed OIDC single sign-on and passkey identity infrastructure. Extended merge-safety CI checks and adversarial coverage.

Creator & Senior Architect | Project Artemis / Current

- Created a locally operated AI agent for offensive security and computer automation, with shell execution, file operations, and reusable skills.
- Architected persistent SQLite memory, filesystem-native skills, and dual-model dispatch for operation on the owner's hardware without cloud inference.

Independent Software Engineer / 2010 - Present

- Create **Galactic Frontier**, a Star Wars fan-made MMO in development, and **Nightmare Engine**, a finished horror game showcasing an engine built for old-school graphics. Also develop native applications, on-device AI, and browser-based creative tools.

TECHNICAL FOCUS

AI & systems: agentic systems, local LLMs, multi-model orchestration, SQLite, JSON-RPC, SSE.

Security & identity: JWS/JWKS, OIDC, SSO, passkeys/WebAuthn, offensive security, adversarial testing, CI/CD.

Software & creative: TypeScript, JavaScript, Node.js, Swift, Python, Convex, Supabase/Postgres, Three.js, WebGL/GLSL, Web Audio, DSP.

SOFTWARE, GAMES & CREATIVE PROJECTS

Selected independent work alongside Lucentive projects. Prototypes and work in development are identified explicitly; public links and further detail are available in the portfolio.

GAMES

Galactic Frontier (In development). A Star Wars fan-made MMO combining planetary exploration, spaceflight, lightsaber combat, racing, and persistent sandbox progression.

Nightmare Engine (Completed showcase). A finished first-person horror game demonstrating my engine for old-school graphics, creature AI, and psychological tension.

Devil Torn (In development). An Amazonian hack-and-slash where combat and restoration reshape a living forest.

Brick Stacker 3D (Playable browser & Android prototype). A one-tap 3D tower-stacking game with precise drops, perfect combos, and unlockable brick skins.

SOFTWARE & CREATIVE PRODUCTION

TagSmith (macOS application). A native media metadata editor designed to preserve the original audio, video, and image payload.

Kagami (Local creative tool). A local 3D VTuber studio that mirrors facial performance onto a VRM avatar.

Kölja Stage (Local creative tool). A local 3D video studio combining segmented video, imported models, and a shared animation timeline.

MeshForge (Local creative tool). Image-to-3D tooling with instant relief geometry and a local model-powered mesh pipeline.

SaberForge (Local creative tool). A parametric 3D saber editor with stackable parts, material previews, and animated GLB export.

PLATFORMS & WORKFLOWS

Intuitive Agent System (Engineering project). A repository-centered framework for coordinating coding agents and retaining engineering decisions.

LucidMatch / UpMatch (Engineering project). An AI-assisted dating-profile coach for photos, profile prompts, and practical next steps.

Lucentive Loop (Engineering project). AI-assisted campaign production connecting briefs, content generation, review, and social publishing.

WhatsApp Work-Intake (Engineering project). Local tooling for capturing selected work conversations and voice notes with a control panel.

AUDIO, VISUALS & LOCAL AI

AURICLE (Open source). A binaural instrument whose WebGL interference patterns follow the audio engine's phase.

Kölja Studio (Browser application). A browser music studio with synthesis, sequencing, generative grooves, and effects.

Raven Stage (Creative project). A real-time render engine for live generative visuals and composable effects.

Lua (Independent project). A private voice assistant running a local language model and text-to-speech on device.

Neo-Human Alliance (Independent project). A creative world and public home for the characters and places of the Neo-Human Alliance.
